Project 3 Report

For Project 3 I had the most trouble but also learned the most. As you can see by the submission time I've cut it pretty close and did not manage my time very well. Despite that I feel that I learned valuable lessons in the process of completing our third project. First I really struggled to find a bootstrap template. I went to 5+ websites and even asked ChatGPT for recommendations but every single one just showed unfinished code with no unified download. So I copied and pasted and frankensteined a template together. That is where all my problems stemmed. In future projects I'll just build the site from scratch so I know what everything does. Most bootstrap templates have overly complicated CSS files with sometimes thousands of lines of code. It took me more time aligning the template to fit the rubric than it did implementing the actual JavaScript. For the JS every time I ran into an issue I either used this https://htmlcheatsheet.com/js/ or https://www.w3schools.com/js/ two fantastic programming resources. I can't really document my "journey" step by step because I did it in one sitting. If I were to make changes I'd line up the text better, have a better structured html file, and maybe add some animations. I hope I did enough for a decent grade. I had no real inspiration besides the TA's tutorial that was provided.
